ANTERIOR SHOULDER INSTABILITY
SURGICAL REPAIR PROTOCOL

This rehabilitation protocol has been developed for the patient following an arthroscopic ACLR surgical procedure. This procedure is normally the result of extreme laxity in the anterior capsule requiring surgical intervention to shrink the area. The protocol is divided into phases. Each phase is adaptable based on the individual and special circumstances. Following an ACLR, the patient should avoid placing stress on the anterior joint capsule. Early passive range of motion is highly beneficial to enhance circulation within the joint to promote healing. The overall goals of the surgical procedure and rehabilitation are to:

• Control pain and inflammation
• Regain normal upper extremity strength and endurance
• Regain normal shoulder range of motion
• Achieve the level of function based on the orthopedic and patient goals

The physical therapy should be initiated within the first week following surgery. The supervised rehabilitation is to be supplemented by a home fitness program where the patient performs the given exercises at home or at a gym facility.

Important post-operative signs to monitor include:
• Swelling of the shoulder and surrounding soft tissue
• Abnormal pain, hypersensitive—an increase in night pain
• Severe range of motion limitations
• Weakness in the upper extremity musculature Return to activity requires both time and clinical evaluation. To most safely and efficiently return to normal or high level functional activity, the patient requires adequate strength, flexibility, and endurance. Functional evaluation including strength and range of motion testing is one method of evaluating a patient’s readiness to return to activity. Return to intense activities following an arthroscopic ACLR requires both a strenuous strengthening and range of motion program along with a period of time to allow for tissue healing. Symptoms such as pain, swelling, or instability should be closely monitored by the patient.
**Phase 1: Week 1-3**  
**ACLR Protocol**

<table>
<thead>
<tr>
<th>WEEK</th>
<th>EXERCISE GOAL</th>
</tr>
</thead>
</table>
| 1-3  | **ROM** Gradual ↑  
Passive to AAROM in scapular plane  
External rotation 0-60° wk 3  
Internal rotation as tolerated  
Passive to AAROM  
Flexion/Elevation as tolerated  
Pendulum exercises  
Wand exercises—all planes within limitations  
Rope/Pulley (flex, scaption)  
Active elbow flexion/extension  
Manual stretching and Grade I-II joint mobs |

**STRENGTH**  
Initiate submaximal/pain free isometrics—all planes  
Grip strengthening with putty or ball

**BRACE**  
Brace for 3 weeks or as noted  
Brace removed to perform exercises above

**MODALITIES**  
E-stim as needed  
Ice 15-20 minutes

**GOALS OF PHASE:**  
• Promote healing of tissue  
• Gradual increase in ROM  
• Control pain and inflammation  
• Independent in HEP  
• Initiate light muscle contraction
Phase 2: Week 3-6
ACLX Protocol

**WEEK** | **EXERCISE GOAL**
---|---
3-6 | **ROM** Full ROM
Continue with all ROM activities from 8 wks previous phase
**NO LIMITATIONS** on ER-avoid extreme end range ER or abduction
Wand exercise-all planes
Rope/Pulley (flex, abd, scaption)
Manual stretching and Grade II-III joint mobs

**STRENGTH**
Initiate UBE for warm-up activity
Initiate IR/ER at neutral with tubing
Initiate forward flexion, scaption, empty can
Prone horizontal abduction, extension to neutral
Sidelying ER
Bicep and tricep strengthening
Initiate scapular stabilizer strengthening

**BRACE** D/C wk 3
Discharge brace at week 3

**MODALITIES**
Ice 15-20 minutes

**GOALS OF PHASE:**
- Gradual increase to full ROM
- Improve upper extremity strength and endurance
- Control pain and inflammation
- Normalize arthrokinematics
Phase 3: Week 6-12
ACLR Protocol

WEEK 6-12 EXERCISE

ROM
Continue all ROM activities from previous phases
Posterior capsule stretch
Towel internal rotation stretch
Manual stretching and Grade II-III joint mobs to reach goal

STRENGTH
Continue all strengthening from previous phases
increasing resistance and repetitions
UBE for strength and endurance
Initiate isokinetic IR/ER at 45° abduction at high speeds
Progress push-up from wall, to table, to floor
Initiate ER with 90° abduction with tubing
Progress overhead plyotoss for dynamic stabilization
Progress rhythmic stabilization throughout range of motion
Initiate lat pulldowns and bench press
Progress PNF to high speed work
Initiate plyoball figure 8 stabilizations

MODALITIES
Ice 15-20 minutes

GOALS OF PHASE:
• Full painless ROM
• Maximize upper extremity strength and endurance
• Maximize neuromuscular control
• Normalize arthrokinematics
• Clinical examination with no impingement signs
Phase 4: Week 12-24
ACLR Protocol

**WEEK** 12-24
**EXERCISE**

**ROM**
Continue all ROM activities from previous phases
Posterior capsule stretch
Towel internal rotation stretch
Grade III-IV joint mobs as needed to reach goal

**STRENGTH**
Continue with all strengthening exercises from previous phases increasing weight and repetitions
Continue total body work out for overall strength
Initiate light plyometric program
Initiate military presses in front of neck
Initiate and progress sport specific and functional drills
Initiate interval throwing program

**MODALITIES**
Ice 15-20 minutes as needed

**GOALS OF PHASE:**
- Return to activity upper extremity strength and endurance
- Return to activity neuromuscular control and arthrokinematics
- Return to sports specific training/functional training
